

Where efficiency, communication and better patient care come together.

COORDINATING CARE THROUGH TEAMS

Knowing When Your Patients Need Care Can Pay Off All Around.

Healthix provides access to data on +16 Million Patients in New York City and Long Island. We partner with more than 1,500 facilities.

Today, Physicians and Care Teams struggle to keep up with the growing demands from patients, insurance companies, regulators and health systems. Improving patient care coordination can free up time, improve care, increase patient capacity and generate income.

Imagine a scenario when your patient goes to the ER and you're notified - in real time. Your office then schedules a follow-up visit within days. You're not only providing great care that your patients will remember, you could receive incentive payments for doing so. Or what if you had a patient's medication history and clinical encounters at your fingertips, before an office visit began. These common situations help your care team coordinate better care and they can save you and your staff valuable time.

Benefits of Connecting to Healthix

- Exchanging information electronically is faster because staff can eliminate faxing and reduce calls with the ER and other providers.
- Sharing a patient record across health providers reduces unnecessary labs/images and can prevent adverse drug events.
- Obtaining a comprehensive snapshot of a patient's medical history across providers and time, can optimize consult time.
- Healthix Clinical Event Notifications (CENs) facilitate the management of patients, especially those with chronic diseases. Physicians are notified via CENs based on a variety of clinical events (hospital discharges, ER visits and more).

**Clinical Event
Notifications
Facilitate Patient
Care Coordination,
Especially for
Patients with
Chronic Diseases**

**Customizable clinical alerts
provide real-time updates for
patients in your care - 24/7.**

Healthix generates and routes real-time, automated Clinical Event Notifications – ED admissions, inpatient admissions, hospital discharges, or other customizable alerts – to a targeted group of care managers and clinicians who coordinate care for rosters of patients.

Healthix alerts are routed in a variety of ways; sent to a smartphone without protected health information or posted on the Healthix Portal. They are also delivered to secure systems to be monitored by care teams and routed accordingly.

With patient consent, doctors and nurses are able to review current community-wide and cross-regional medical history, including diagnoses, medications, allergies, labs and other vital information – wherever and whenever it's needed.

**Secure access to patient information,
wherever and whenever it's needed.**
